The Undergrad Geoclub is now a tender three years old, and is continuing to grow. Our club was founded by undergraduate students to give geology undergads an avenue to further explore the geological sciences. Our goal is to encourage our members to become a part of department gatherings, to explore geological features with peers, and to become more involved with the department through information provided at our meetings. The founders and the previous presidents have laid down the foundation of the young club. The theme for the club this year is "building up."

A focus of our group this year has been the Board of Visitors and the Mentorship Program. The mentoring program is designed to help all students learn valuable information from experienced alumni. (See letter from Jay Nania.)

We have also been busy this fall with a newly implemented agenda. Each month, in addition to the regular meetings, we hold an event. The fall semester saw Undergrad Geoclub members at GSA and the Museum of Science and Industry. GSA was a whirlwind of a trip, interacting with graduate students to give undergrads the opportunity to experience the largest geology convention. Our trip to the Museum of Science and Industry was just as fun and informative.
